

Hyrum

1. Rose graph

This graph illustrates the relative frequencies for which the wind blows at certain speeds in certain directions. The wind directions are highly varied at the Hyrum City site; however, the stronger winds blow from more frequently from the southwest.

2. Diurnal graph

This graph shows the average wind speed measured at each time of day in m/s, where Hour 0 corresponds to midnight. Note the increased wind speed in the late evening and early morning.

Similarly, this graph shows the average wind speed for each month of data collected by the anemometer (beginning in January). Early summer shows wind speeds that are double those of winter.
